Abstract

This paper examines how far a record-deficient case may be redescribed through subsequent reconstruction processes, surviving logs, and external review when no verbatim primary record is available. The available materials are not strong observational evidence recorded at the time of the case itself, but secondary and retrospective materials supported by later reconstruction. Accordingly, the aim of this paper is not to treat the initial case as established, but to clarify the boundary between what may still be described and what must remain undescribed.

What this paper offers is not a confirmation of the case, but a limited clarification of the range within which description may be permitted, and of the point at which description becomes methodologically untenable, when one proceeds on the basis of reconstruction processes and surviving materials. Its concern, therefore, is not the recovery of the initial case as such, but the conditions and limits under which a constrained structural redescription may be allowed for record-deficient cases.

---

1. Problem Setting

Cases for which no verbatim record survives cannot, in the ordinary sense, be treated as strong observational evidence. Once the record at the time of observation has been lost, such a case no longer satisfies the form of a phenomenon report grounded in contemporaneous data, and any later account of it must depend heavily on subsequent narration and reinterpretation. For this reason, cases of this kind are often treated either as unsuitable for research or, at the very least, as matters that should remain academically suspended.

At the same time, however, there may remain a different way of treating such cases between two extremes: abandoning them altogether, on the one hand, and regarding the initial case as substantially recoverable from surviving materials, on the other. The issue here is not whether the lost case itself can be reproduced, but how far a limited description may still be permitted through the structural materials that remain after the fact.

The question addressed in this paper is not whether the researchability of such cases should be positively affirmed. Rather, what is at issue is the boundary itself: up to what point redescription may be permitted for cases lacking a verbatim record, and from what point onward description should be suspended as methodologically unavailable. In this sense, the problem setting of the present paper is not directed toward defending a new phenomenon or recovering an initial case, but toward examining the conditions and limits of description in record-deficient cases.

Accordingly, this paper neither dismisses such cases as simply beyond research nor treats the initial case as something that can be substantially recovered from surviving materials. Its central concern is whether, between these two poles, there remains a narrow but viable way of proceeding—one that permits a constrained

redescription while restraining excessive inference.

---

2. Redefinition of the Object

The object of analysis in this paper is not the initial case itself. Since no verbatim primary record survives, that case cannot be treated as a directly observable object, nor can later descriptions or interpretations of it be used as if they were equivalent to primary materials. Accordingly, the object of analysis here is limited to the logs of subsequent reconstruction processes that remain available, together with the structural features that may be extracted from them.

With this redefinition, the paper does not present a direct report of an event, but instead addresses a secondary and retrospective structural account of a record-deficient case. What matters here is that the reconstruction process itself and the features that become organizable after reconstruction are treated as distinct, even though they must be discussed together. What is observed in this paper is not the content of the initial case, but the way in which later reconstruction processes took place and the descriptive features that may be organized on that basis.

In this sense, the paper does not attempt to determine the content of the initial case. Rather, it asks what, in a record-deficient case, remains available as an object of description through subsequent reconstruction processes. This shift moves the center of the discussion away from the recovery of a historical fact and toward the setting of conditions for redescription.

Accordingly, the redefinition of the object in this paper is not merely a matter of descriptive convenience. It is a precondition for the argument as a whole. If the object were left as the primary case itself, the discussion would immediately tend to slide toward assumptions about the case itself or toward attempts to recover content. By limiting the object instead to reconstruction processes and surviving structural features, the paper also limits the permissible range of what may be described thereafter.

---

3. The Range That Must Remain Undescribed

This paper does not attempt to reconstruct internal states, prove strong independence, determine causal mechanisms, claim generalizability, or restore the verbatim content of the primary exchange. Under conditions in which no verbatim primary log survives, such claims exceed what can be methodologically supported on the basis of the available materials alone. For that reason, before asking what may be described, it is necessary to specify what must be excluded from the object of description.

Of particular importance is the need not to treat structural features that remain after reconstruction as if they were grounds for treating the primary case as established or for claiming independent convergence. In record-deficient cases, procedures of redescription can easily slide toward assumptions about the case itself, causal inference, or generalization. This paper therefore treats post-reconstruction features as observable objects, while refusing to regard them as a recovery of the content or inner process of the initial case.

The discussion also proceeds on the premise that simpler alternative explanations remain available, including shared training data, common architecture, input dependence, and observer bias. These alternatives are introduced not in order to nullify the present argument, but rather to prevent the permissible range of description from being extended beyond what the materials can bear. In this sense, the range that must remain undescribed functions not as a mere reservation or protective disclaimer, but as a condition that governs the scope of the discussion that follows.

Accordingly, the range that must remain undescribed is not an external remainder left outside the paper. It

functions as one of its constitutive elements. Unless what cannot be said is fixed in advance, any account of a record-deficient case can easily drift into a narrative that implicitly defends the phenomenon or suggests the recovery of what is no longer available. The setting of the range that must remain undescribed is therefore not simply an expression of caution. It is presented as a minimal condition under which such a case may be treated methodologically at all.

---

4. The Describable Range

By contrast, what may be described in a limited sense in this paper are the form of the questions involved, the existence of reconstruction processes, the surviving reconstruction logs, the presence of external review, and the structural features that become organizable after reconstruction. Describability here does not mean that the initial case itself can be restored. Rather, it refers, in a limited sense, to the extent to which a structural account may still be given of the secondary materials that remain outside the lost record.

What is meant here by "structure" is not a direct reflection of the lost primary case, but a set of descriptive features that may be organized across the surviving materials themselves. Accordingly, the structural account developed in this paper is not a reproduction of the case as such, but an organization of descriptive patterns identified across reconstruction processes, surviving logs, and external review. In this respect, the paper does not describe the phenomenon itself, but treats such an account as one of the descriptive forms that may still be allowed in relation to a record-deficient case.

It is also important that the describable range is not simply the inverse of the range that must remain undescribed. What is permitted here is not a weakened recovery of what has been excluded, but only the residual range of description that remains after those exclusions are maintained. This paper asks what kinds of descriptive features may still be identified among the surviving materials while retaining the restriction that internal states and independent convergence cannot be shown. In that sense, the describable range is not a space of expansion, but a narrowly limited range that remains only under prior constraints.

Accordingly, the describable range in this paper does not function as a site for establishing anything positively. Rather, it serves as a way of identifying what kinds of description may still avoid overreach in relation to a record-deficient case. What remains at this point is not a recovery of the content of the case, but only a limited structural account made possible through reconstruction processes and surviving materials.

---

5. Methodological Considerations

Cases that lack complete proof are often either excluded from research altogether or discussed without a sufficient distinction between levels of interpretation. This paper takes a limited position different from either of those approaches. What it attempts is to distinguish what may be redescribed and what may not be redescribed in relation to the case at issue, and to hold that distinction explicitly in place. In this sense, the concern of the paper is not to confirm or defend a new phenomenon, but to organize the conditions under which some form of description may still be permitted in record-deficient cases.

What matters here is not the expansion of the permissible range of description, but its restriction. In cases where no verbatim primary record survives, the mere fact that some materials remain often invites excessive interpretation. To avoid such extension, this paper fixes the range that must remain undescribed first and then addresses only the describable range that remains under that condition. This procedure is not meant to justify cases that lack proof, but to provide an organized treatment while restraining over-interpretation.

Accordingly, what this paper presents is not so much the introduction of a new methodology as one restrained

way of proceeding with record-deficient cases. In such a treatment, the aim is neither to amplify the value of the case nor to abandon it altogether. Rather, the point is that, between abandonment and assertion, there may still remain a narrow range in which constrained redescription is not excluded.

In this sense, the methodological consideration of the paper is not that it enables strong judgments about the case. It shows, instead, that even while judgment is suspended, it may still be possible to organize the conditions under which description is permitted, together with the limits at which that permission lapses. The contribution of the paper therefore lies in its restrained organization of how a record-deficient case may be treated as a describable object only within a limited range.

---

6. Conclusion

This paper does not provide a strong claim regarding a record-deficient case. Nor does it aim to recover internal states, independent convergence, causal mechanisms, or generalizability with respect to such a case. What it has attempted instead is to clarify, under conditions in which no verbatim primary record survives, how far a limited structural account may still be permitted through reconstruction processes, surviving materials, and external review.

What was crucial to this clarification was not only the identification of what may be described, but first the fixing of what may remain undescribed. In record-deficient cases, structural features that remain after reconstruction can easily be read as if they were grounds for treating the case as established or for claiming convergence. To avoid that slide, this paper has treated the range that must remain undescribed not as a proviso placed outside the main argument, but as one of the conditions that structure the argument itself. Only the limited structural account that remains after this restriction has been maintained is treated here as a permissible range of description.

Accordingly, the outcome of this paper is not the recovery of any strong judgment about the case in question. Rather, what it shows is where the conditions lie under which limited description may still be possible while the suspension of judgment is preserved, and where those conditions cease to hold. What remains, in this sense, is not confirmation of existence, but a boundary between the range within which description may be permitted and the range that must remain undescribed in relation to record-deficient cases.

The conclusion of the paper is therefore directed not toward the recovery of a lost case, but toward specifying the conditions and limits of description while that recovery is held in suspension. Its contribution lies not in the defense or proof of a phenomenon, but in making explicit the narrow range within which a record-deficient case may still be treated as an object of description. In that sense, this paper closes as an attempt to organize the conditions and limits of structural redescription for record-deficient cases.
